Original publisher: Golden, Colo. : Solar Energy Research Institute, 1988 OCLC Number: (OCoLC)535531391 Subject: Heat exchangers -- Computer simulation. Excerpt: . . . TR-3108 1. 0 INTRODUCTION This report summarizes extensive work carried out at the Solar Energy Research Institute (SERI) in developing direct-contact condensers for use in the Claude-cycle ocean thermal energy conversion systems. The primary focus of the effort was to develop a numerical model of the condenser and to determine how well this model predicts the behavior observed in the parallel experimental program using structured packings as the gas-liquid contacting device. We also provide detailed descriptions on the study's background, previous work in this field, the numerical model, the experimental facility and instrumentation, and the uncertainties in primary and derived parameters. Full sets of measurements made at SERI and their corresponding predictions yielded by the model accompany this report. Figure 1-1 shows a schematic of an open-cycle (Claude-cycle) ocean thermal energy conversion (OC-OTEC) power system. Warm seawater (about 25°C) enters the evaporator section of a vacuum chamber. Pressure in the evaporator is maintained sufficiently low to produce steam. This is done by operating below the vapor pressure at the incoming surface water temperature. Water droplets carried by the wet steam are removed in a mist eliminator. The steam expands through a turbine between the evaporator and the condenser section of the chamber. Cold seawater (about 5°C), pumped from a depth of about 1000 m, is used as the heat sink in the condenser. The turbine is mechanically linked to a generator that yields net power after providing the power required to pump the warm and cold water streams and to remove noncondensable gases...
