Original publisher: Hampton, Va. : National Aeronautics and Space Administration, Langley Research Center, 1990 OCLC Number: (GPO)apn1992-042706 Excerpt: . . . i. e. where  $G = 2G_b - 0. G_1 - G_A$  numerical solution to ( 2. 10a ) using a Runge-Kutta method shows that this occurs when  $7 - 1.971510$ , in which case  $-0.993934$  ( 3. 7 ) The corresponding real value of  $\omega$  and is obtained by integrating ( 3. 4 ) from 0 to  $7 - \infty$  with an appropriate treatment at the generalised inflection point. Such a calculation predicts that the neutral value of  $\omega$  and is  $0.645065$ . ( 3. 8 ) However, of greater significance are the unstable eigenmodes. Figure ( 3. 1 ) illustrates the dependence of the growth rate,  $t$ , on the real wavenumber  $\alpha$  and  $\beta$ . We see that the growth rate attains its maximum value of  $0.256853$  at  $\alpha = 0.143619$ ; further it turns out that the acoustic modes have smaller growth rates ( see below ) so that this is the most unstable inviscid mode for a hypersonic boundary layer. In Figure ( 3. 2 ) we show the eigenfunction of the vorticity mode equation at different values of the wavenumber. This figure indicates that as the wavenumber decreases the eigenfunction starts to expand out of the transition layer. We note here that as defined above is independent of  $T$  and that the growth rate is obtained from ( 3. 3b ) by dividing  $\omega$  by  $(Tb - 1)$  (  $-1$  ). It follows that wall cooling has a destabilizing effect on the vorticity mode. The structure of the growth-rate curves at small wavenumbers is of interest because for sufficiently small values of the wavenumber we expect that the vorticity...
